DETAILED ACTION

The indicated allowability of claims 14-19 is withdrawn in view of the newly discovered reference(s) to JP 55022875 and JP 56060049. Rejections based on the newly cited reference(s) follow.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 14-19 are rejected under 35 U.S.C. 103(a) as being unpatentable over JP 55022875 in view of JP 56060049. The JP 55022875 reference teaches the use of a graded base region in a lateral transistor where the doping profile is such that the impurity concentration of the base decreases toward the periphery, that is, toward the collector region. See, for example, the doping profile in FIG. 2(b) of JP 55022875. This reference teaches all of process features of the invention with the exception of the formation of a plug region extending down from the surface of the device to the buried region (12).

However, JP 56060049 shows a similar transistor structure and process, and shows the formation of such a claimed plug region, for example, region (9), which contacts the buried region (2). As shown in JP 56060049, it would be obvious to one skilled in the art to combine these references so as to provide a plug region to contact either of the base or collector regions, as shown in FIG. 2.

Taken together, these references appear to teach all of the claimed process steps.
